

**LISTING OF CLAIMS:**

Claims 1-9 (Canceled)

10. (Previously presented) A voice control system that recognizes a speech uttered by a user to thereby control a device that has a plurality of operating states, comprising:

a storing unit for storing speech recognition data including a plurality of reference commands;

a speech recognizing unit for recognizing the speech as a recognized reference command included in the reference commands stored in the storing unit;

a detecting unit for detecting a certain operating state of the device; and

a substituting unit for determining whether each of the reference commands recognized by the speech recognizing unit is a selectable reference command that can be selected in the certain operating state, and for substituting, when the recognized reference command is determined to be not the selectable reference command, one of the selectable reference commands for the recognized reference command,

wherein, when the recognized reference command is one of a reciprocal pair of two reference commands that are for working oppositely to each other and the recognized reference command is determined to be not the selectable reference command, the

substituting unit substitutes the other of the reciprocal pair for the recognized reference command.

11. (Original) The voice control system according to Claim 10,

wherein the reciprocal pair include an enabling reference command and a disabling reference command, and

wherein the enabling reference command is for enabling one of that the device is running and that a function of the device is functioning, while the disabling reference command is for disabling one of that the device is running and that the function of the device is functioning.

12. (Currently amended) The voice control system according to Claim 10,

wherein, if the certain operating state of the device is an operating state where a function of the device is functioning, and ~~wherein~~ the function of the device functions in multiple steps, and ~~wherein~~ each of the reciprocal pair controls the function of the device for moving into one of the multiple steps, ~~and~~

~~wherein~~ then, even when the recognized reference command is one of the reciprocal pair and is determined to be not the selectable reference command, the substituting unit ~~does not~~

~~substitute~~is configured to prevent substituting the other of the reciprocal pair for the recognized reference command.

13. (Original) The voice control system according to Claim 12, further comprising:

a notifying unit for notifying that the recognized reference command cannot be executed.

Claims 14-16 (Canceled)
